

**BRAC UNIVERSITY**  
**Department of Computer Science and Engineering**

Examination: Semester Midterm  
Duration: 1 hour 10 min

Semester: Summer 2023  
Full Marks: 30

CSE 320: Data Communications

Answer the following questions.  
Figures in the right margin indicate marks.

**SET A**

Name:	ID:	Section:
-------	-----	----------

1. [CO1]	a)	Suppose there are 4 buildings in BRACU's new campus. Buildings are connected using bus topology. Each building has 3 CSE Labs. Each Lab has 4 computers. The computers are connected using mesh topology but the Labs of a single building are connected using star topology. <b>Draw</b> the BRACU new campus hybrid topology. How many links will there be (links are using full-duplex transmission mode)?	[5]
	b)	<b>Identify</b> the name of the <b>TCP/IP model</b> layers based on the following functionalities. <ul style="list-style-type: none"><li>• Enables resource sharing and remote file access among network users.</li><li>• Responsible for converting data into signals for transmission over a physical medium.</li><li>• Responsible for establishing and terminating communication sessions.</li><li>• Ensure reliable hop to hop transmission.</li></ul>	[2]
	c)	<b>Identify</b> at least 2 differences amongst logical, physical and port addresses. Explain with an example why all these addresses are needed?	[3]

<p>2. [CO2]</p>	<p>a)</p>	<div data-bbox="469 208 1206 349" data-label="Figure"> </div> <p style="text-align: center;"><b>Figure 2.a: Analog Signal (time Vs Amplitude)</b></p> <p>In the above Figure 2.a, <b>determine</b> the time period and frequency of the analog signal. Also show the frequency domain representation of the signal if the maximum amplitude is 20V.</p>	<p>[3]</p>
	<p>b)</p>	<p>Suppose the signal power is 5 MW at point A. The power loss rate at the wire from A to B is 5 kW/km and from C to D is 0.05 dB/km. <b>Calculate</b> the total change of signal power in decibel and comment if the power is being amplified/attenuated.</p> <div data-bbox="405 857 1181 1052" data-label="Diagram"> </div>	<p>[3]</p>
	<p>c)</p>	<p>Consider a communication channel that requires to send 108 GB within 6 hours. The link operates on signals with frequency range from 900 KHz to 14 MHz. If the link is perfect, i.e., no noise is introduced in the link,</p> <ul style="list-style-type: none"> <li>• <b>Determine</b> the number of voltage levels needed to fulfill the requirement.</li> <li>• In practice, there is no noise free channel. Suppose, the strength of the noise power is 20mW which is 60 times weaker than the signal power. <b>What</b> will be the channel capacity considering the noise?</li> </ul>	<p>[2+2]</p>

3.  
[CO2]

- a) Two devices A and B are sending digital signals using the NRZ-I-line coding scheme. Device C is receiving the signal simultaneously and combining them using bitwise AND operation. Then produces the final digital signal using a line coding scheme that doesn't have the consecutive 0 problem. Illustrate the final signal produced by C. [You can use any valid line coding scheme for C] [Draw it in the question paper only.]

[5]

- b) The following figure depicts a sampled analog signal for digital signal representation. By applying the concept of **Pulse Code Modulation**, assume there will be **3-bit** code words for each sampled amplitude. **Show the normalized Quantized value and quantization code** for the given analog signal value at different time stamps. Assume that the sampling amplitudes are between -40V to +40V.
